# Code Injection

- Search about other PHP functions that can cause a code injection attack
  - We already covered these:
    - `include()` - `include_once()` - `require_once()` - `eval()`
- Find at least two more functions/constructs

# Code Injection - Solution

- There are many functions potentially vulnerable to Code Injection (PHP core functions as well as many third-party libraries)
- Noticeably the following:
  - `assert()`
    - <http://php.net/manual/en/function.assert.php>
  - `preg_replace('/.*'/e',...)`
    - <http://php.net/manual/en/function.preg-replace.php>
  - `create_function()`
    - <http://php.net/manual/en/function.create-function.php>
